A:Title: Complete sequence and gene organization of the genome of a hyper-thermophilic at A:Reference number: A71000; MUID:98344137; PMID:9579194

A:Accession: D71203

A:Status: preliminary: nucleic acid sequence not shown; translation not shown

A:Molecule type: DNA

A:Residues: 1-650 <KAN>
A:Cross-references: GB:AP000007; NID:g3236134; PIDN:HAA31019:1; P1DD:g4258336

A:Experimental source: strain O73

A:Mote: this accession replaces an interim accession for a sequence replaced by GenBank
C:Superfamily: ATP-dependent RNA helicase eIF-4A
C:Keyvords: ATP: nucleotide binding; P-loop
F:33-40/Region: nucleotide-binding motif A (P-loop)
F:131-136/Region: DEAD/H motif

Patent No. 6444466
GENERAL INFORMATION:
                                                                                                                                                                                                                                                        APPLICANT: Donna T. Ward
APPLICANT: Andrew T. Watt
TITLE OF INVENTION: ANTISENSE MODULATION OF HELICASE-MOI EXPRESSION
FILE REFERENCE: RTS-0217
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   LENGTH: 301 base pairs
TYPE: nucleic acid
STRANDEDNESS: single
TOPOLOGY: linear
MOLECULE TYPE: cDNA
HYPOTHETICAL: NO
ANTI-SENSE: NO
  315

                                                                                                                                                                                                                                                            CC The present invention relates to an isolated nucleic acid encoding a CC melanoma differentiation associated gene-5 (Mda-5) polypeptide. Mda-5 CC contains a caspase recruitment domain (CARD) and a RNA helicase motif. CC Mda-5 is a novel interferon (IFN) inducible gene with structural CC similarities to RNA helicases and CARD motif containing proteins. Mda-5 is induced during terminal differentiation in human melanoma cells CC is induced during terminal differentiation. Mda-5 is useful for identifying CC compounds that compound mezerein (MEZ), Mda-5 is useful for treating CC compounds that may induce its expression. Mda-5 is useful for treating CC cancer e.g., melanoma, neuroblastoma, astrocytoma, gliobhastoma CC cancer, seteosarcoma, chrondosarcoma and especially where the cancer is CC cancer of the central nervous system and apoptosis. The Mda-5 promoter CC exhibits melanocyte tissue specificity and minimises systemic toxicity.

                                                                                                                                                                                                                                                                                                   SXCCCCCCXXTTTTXEEXCXEXEXCXC
                                                                                                                                                                                                                                                                                                                       The present sequence is the coding sequence for human HHI16. RHI16 is a 116kDa protein and has homology to RNA helicoses (DEXH box). RHI16 and its coding sequence are useful for treating cancer; acute or chronic infections (especially by HIV or hepatitis H or C): inherited genetic diseases; (auto)immune diseases (particular, rheumatism, arthritis, arthritis, osteoporosis and diabetes but many others listed) and to prevent graft rejection. RHI16 and its coding sequence are also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (ISTA-)

CC Mda-5 is a novel interferon (IFN) inducible gene with attractural CC similarities to RNA helicases and CARD motif containing proteins. Mda-5 (Similarities to RNA helicases and CARD motif containing proteins. Mda-5 (CC is induced during terminal differentiation in human melanoma cells CC treated with the combination of recombinant fibroblast FNN and the CC antileukaemic compound mezerein (MEZ). Mda-5 is useful for treating CC cancer e.g., melanoma, neuroblastoma, astrocytoma, glibblastoma CC multiforme, cervical cancer, breast cancer, colon cancer, prostate CC cancer, osteosarcoma, chrondosarcoma and especially where the cancer CC acancer of the central nervous system and apoptosis. The Mda-5 promoter CC exhibits melanocyte tissue specificity and minimises systemic toxicity. CC The present sequence is human Mda-5 protein-related DNA.

CC Note: The present sequence is designated SEQ ID NO:2 in the sequence is not correspond to the sequence designated SEQ ID NO:2 in the present sequence is not further referred to in the specification, and has been represented CC in the main body of the specification (AAEIUIS5). The present sequence is continued to the specification and the sequence is not further referred to in the sequence listing.

Novel polypeptides and polynucleotides useful for diagnosing, preventing, treating neural, immune system, muscular, reproductive, pulmonary, cardiovascular, renal, proliferative disorders and cance and cancerous

Claim 4; SEQ ID No 186; 1180pp; English.

The present invention relates to the isolation of novel human enzyme CC polypeptides (AAU22915-AAU23814), and the cDNA and genomic sequences CC encoding them. The enzyme polypeptides of the invention may comprise the CC disportances or ligases of exidereductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the CC disporters including hyperproliferative disporters (e.g. cancer), CC immunodeficiency disorders (e.g. AIDS) autoimmune disorders disporters (e.g. cancer), CC (e.g. arthritis), neurological disorders (e.g. Alzheimer's disporters (e.g. arthritis), neurological disorders (e.g. althrosoclerosis), CC (e.g. asthma), cardiovascular disorders (e.g. atherosoclerosis), CC (e.g. infertility) and infectious disorders (e.g. Influence). The complete of the invention can also be used in gene through, the CC polynucleotides of the invention.

CC (ASAO785-AAS41684 represent cDNA sequences encoding for the nevel human construction, but was obtained in electronic format directly from WIPO cc at fig. wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                            116kDa protein and has homology to RNA helicases (DEXH lox). RH116 is a lis coding sequence are useful for treating cancer; acute or chronic infections (especially by HIV or hapatitis H or '); inherited genetic diseases; (auto)immune diseases (particularly rheumatism, arthritis, arteriosclerosis, osteoporosis and diabetes, but many others listed) and to prevent graft rejection. RH116 and its coding sequence are also useful present accessor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; RH116; RNA helicase; cytostatic; virucide; antichty; immunosuppressive; immunostimulatory; anticheumatic; actiarthritic; antinfermostierotic; osteopathic; antidiabetic; hepatrotropic; antinflammatory; cancer; infection; HIV; hepatritis; genetic diseas, autoimmune disease, craft referring disease.

                                                                                                                                                                       The invention relates to human nucleic acids (AA157798 AA16136%) and the encoded polypeptides (AAM38642-AAM42213) with nootcopic, immunosuppressant and cytostatic activity. The polypucthotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries peripheral neuropathy and localised neuropathies and central nervous system disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity, chemotactic/chemokinetic activity, beemostatic and thromblutic activity.
